

# Data Transformation with dplyr Cheat Sheet

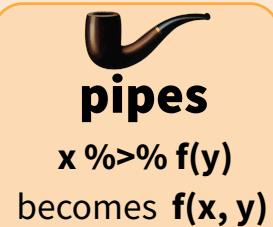

dplyr functions work with pipes and expect **tidy data**. In tidy data:

Each **variable** is in its own **column**

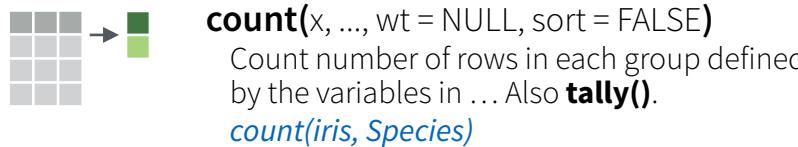

Each **observation**, or **case**, is in its own **row**

## Summarise Cases

These apply **summary functions** to columns to create a new table. Summary functions take vectors as input and return one value (see back).

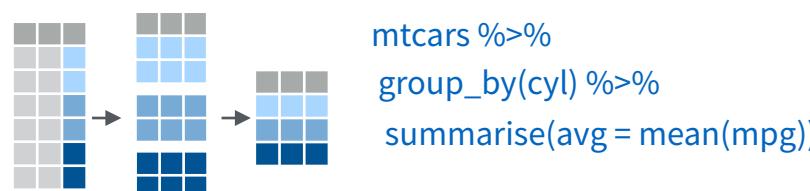

### Variations

- **summarise\_all()** - Apply funs to every column.
- **summarise\_at()** - Apply funs to specific columns.
- **summarise\_if()** - Apply funs to all cols of one type.

## Group Cases

Use **group\_by()** to created a "grouped" copy of a table. dplyr functions will manipulate each "group" separately and then combine the results.

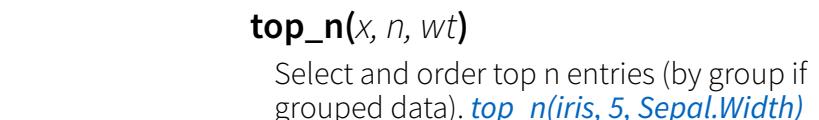

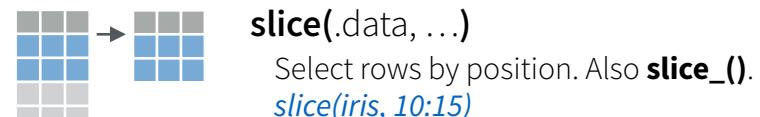

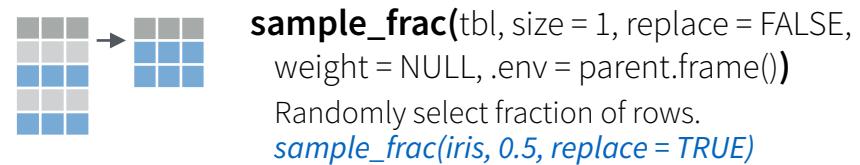

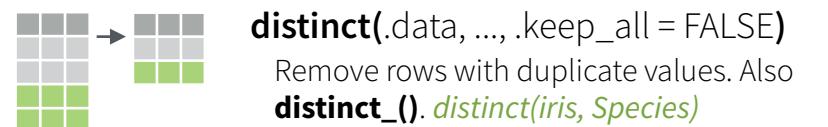

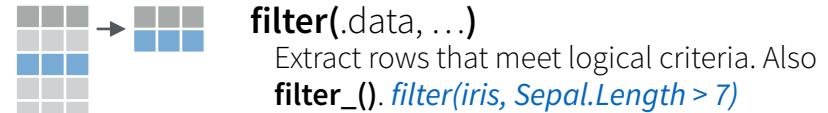

**group\_by**(.data, ..., add = FALSE)  
Returns copy of table grouped by ...  
`g_iris <- group_by(iris, Species)`

**ungroup**(x, ...)  
Returns ungrouped copy of table.  
`ungroup(g_iris)`

## Manipulate Cases

### Extract Cases

Row functions return a subset of rows as a new table. Use a variant that ends in \_ for non-standard evaluation friendly code.

**Logical and boolean operators to use with filter()**

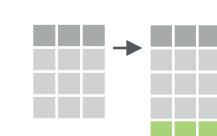

<	<=	is.na()	%in%		xor()
>	>=	!is.na()	!	&	

See [?base::logic](#) and [?Comparison](#) for help.

### Arrange Cases

#### arrange(.data, ...)

Order rows by values of a column (low to high), use with **desc()** to order from high to low.  
`arrange(mtcars, mpg)`  
`arrange(mtcars, desc(mpg))`

**Add Cases**

**add\_row**(.data, ..., .before = NULL, .after = NULL)  
Add one or more rows to a table.  
`add_row(faithful, eruptions = 1, waiting = 1)`

## Manipulate Variables

### Extract Variables

Column functions return a set of columns as a new table. Use a variant that ends in \_ for non-standard evaluation friendly code.

**Use these helpers with select(),**  
e.g. `select(iris, starts_with("Sepal"))`

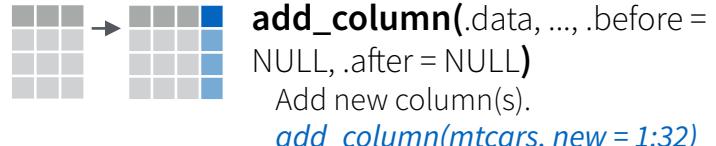

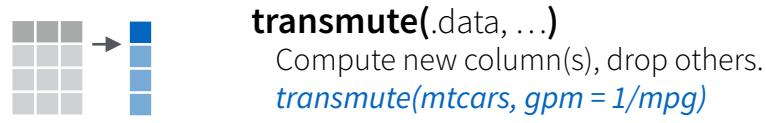

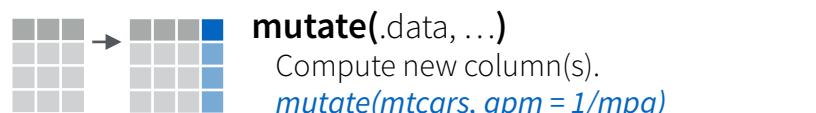

`contains(match)`  
`ends_with(match)`  
`matches(match)`

`num_range(prefix, range)`  
`one_of(...)`  
`starts_with(match)`

: e.g. `mpg:cyl`  
-, e.g. `-Species`  
`everything()`

### Make New Variables

These apply **vectorized functions** to columns. Vectorized funs take vectors as input and return vectors of the same length as output (see back).

## Vectorized Functions

### to use with mutate()

**mutate()** and **transmute()** apply vectorized functions to columns to create new columns. Vectorized functions take vectors as input and return vectors of the same length as output.

#### Offsets

`dplyr::lag()` - Offset elements by 1  
`dplyr::lead()` - Offset elements by -1

#### Cumulative Aggregates

`dplyr::cumall()` - Cumulative all()  
`dplyr::cumany()` - Cumulative any()  
`cummax()` - Cumulative max()  
`dplyr::cummean()` - Cumulative mean()  
`cummin()` - Cumulative min()  
`cumprod()` - Cumulative prod()  
`cumsum()` - Cumulative sum()

#### Rankings

`dplyr::cume_dist()` - Proportion of all values <=  
`dplyr::dense_rank()` - rank with ties = min, no gaps  
`dplyr::min_rank()` - rank with ties = min  
`dplyr::ntile()` - bins into n bins  
`dplyr::percent_rank()` - min\_rank scaled to [0,1]  
`dplyr::row_number()` - rank with ties = "first"

#### Math

+, -, \*, /, ^, %/%, %%% - arithmetic ops  
`log()`, `log2()`, `log10()` - logs  
<, <=, >, >=, !=, == - logical comparisons

#### Misc

`dplyr::between()` -  $x \geq \text{left} \& x \leq \text{right}$   
`dplyr::case_when()` - multi-case if\_else()  
`dplyr::coalesce()` - first non-NA values by element across a set of vectors  
`dplyr::if_else()` - element-wise if() + else()  
`dplyr::na_if()` - replace specific values with NA  
`pmax()` - element-wise max()  
`pmin()` - element-wise min()  
`dplyr::recode()` - Vectorized switch()  
`dplyr::recode_factor()` - Vectorized switch() for factors

## Summary Functions

### to use with summarise()

**summarise()** applies summary functions to columns to create a new table. Summary functions take vectors as input and return single values as output.

#### Counts

`dplyr::n()` - number of values/rows  
`dplyr::n_distinct()` - # of uniques  
`sum(!is.na())` - # of non-NAs

#### Location

`mean()` - mean, also `mean(!is.na())`  
`median()` - median

#### Logicals

`mean()` - Proportion of TRUE's  
`sum()` - # of TRUE's

#### Position/Order

`dplyr::first()` - first value  
`dplyr::last()` - last value  
`dplyr::nth()` - value in nth location of vector

#### Rank

`quantile()` - nth quantile  
`min()` - minimum value  
`max()` - maximum value

#### Spread

`IQR()` - Inter-Quartile Range  
`mad()` - mean absolute deviation  
`sd()` - standard deviation  
`var()` - variance

## Row names

Tidy data does not use rownames, which store a variable outside of the columns. To work with the rownames, first move them into a column.

A	B	C
1	a	a
2	b	b
3	c	c

#### rownames\_to\_column()

Move row names into col.  
`a <- rownames_to_column(iris, var = "C")`

A	B	C
1	a	a
2	b	b
3	c	c

#### column\_to\_rownames()

Move col in row names.  
`column_to_rownames(a, var = "C")`

Also `has_rownames()`, `remove_rownames()`

## Combine Tables

x	A	B	C
a	t	1	
b	u	2	
c	v	3	

y	A	B	D
a	t	3	
b	u	2	
d	w	1	

Use `bind_cols()` to paste tables beside each other as they are.

A	B	C	A	B	D
a	t	1	a	t	3
b	u	2	b	u	2
c	v	3	d	w	1

**bind\_cols(...)**  
Returns tables placed side by side as a single table.  
BE SURE THAT ROWS ALIGN.

Use a "Mutating Join" to join one table to columns from another, matching values with the rows that they correspond to. Each join retains a different combination of values from the tables.

A	B	C	D
a	t	1	3
b	u	2	2
c	v	3	NA

**left\_join(x, y, by = NULL, copy = FALSE, suffix = c(".x", ".y"), ...)**  
Join matching values from y to x.

A	B	C	D
a	t	1	3
b	u	2	2
d	w	NA	1

**right\_join(x, y, by = NULL, copy = FALSE, suffix = c(".x", ".y"), ...)**  
Join matching values from x to y.

A	B	C	D
a	t	1	3
b	u	2	2
c	v	3	NA

**inner\_join(x, y, by = NULL, copy = FALSE, suffix = c(".x", ".y"), ...)**  
Join data. Retain only rows with matches.

A	B	C	D
a	t	1	3
b	u	2	2
c	v	3	NA

**full\_join(x, y, by = NULL, copy = FALSE, suffix = c(".x", ".y"), ...)**  
Join data. Retain all values, all rows.

A	B.x	C	B.y	D
a	t	1	t	3
b	u	2	u	2
c	v	3	NA	NA

Use `by = c("col1", "col2")` to specify the column(s) to match on.

**left\_join(x, y, by = "A")**

A.x	B.x	C	A.y	B.y
a	t	1	d	w
b	u	2	b	u
c	v	3	a	t

Use a named vector, `by = c("col1" = "col2")`, to match on columns with different names in each data set.

**left\_join(x, y, by = c("C" = "D"))**

A1	B1	C	A2	B2
a	t	1	d	w
b	u	2	b	u
c	v	3	a	t

Use `suffix` to specify suffix to give to duplicate column names.  
**left\_join(x, y, by = c("C" = "D"), suffix = c("1", "2"))**
